

Bill Glover

Staff / Senior Software Engineer — Backend, Cloud & Embedded Systems

Amarillo, TX · Remote · Available now for contract and staff augmentation

bill@billglover.com · 806-433-0866 · github.com/scriptgadget · billglover.com

SUMMARY

Hands-on senior engineer with thirty years building production systems where the cost of failure is high: feedmill control deployed across 65 feedyards, dam and river control for the Bureau of Reclamation, airline operations software, and a global philanthropic giving platform on AWS. Comfortable from embedded C up through cloud architecture. I ship, I debug the hard ones, and I lead by doing. Looking for hands-on senior IC work, not management.

CORE SKILLS

Languages: Java, C, C++, Python, Bash, JavaScript, HTML/CSS

AWS (production): EC2, RDS, DynamoDB, Lambda, API Gateway, SQS, CloudFront, S3, ELB, Route 53, CloudFormation, Step Functions

Infrastructure: Docker, Docker Swarm, Redis, SendGrid, Linux

Domains: AgTech and embedded control, cloud platforms, airline/travel systems, nonprofit and mission-driven SaaS, RFID

EXPERIENCE

Independent — Contract Engineering & Technical Advisory 2025–Present

Contract backend and cloud engineering plus technical advisory for early-stage and mission-driven companies. Cloud architecture, modernization, and internal tooling.

GlobalGiving — Engineering (AWS platform) 2018–2025

One of the largest global crowdfunding platforms, connecting nonprofits and donors in nearly every country.

- **Consulting Engineer (2024–2025):** Drove modernization and compliance work, supported business continuity, reinforced engineering best practices on the production AWS platform.
- **Director of Engineering (2021–2024):** Owned architecture and delivery for the platform while staying close to the code. Led the team through scaling, reliability, and technical-debt work without burning people out.
- **Senior Software Engineer (2018–2021):** Hands-on development and architecture across the AWS-based giving platform.

AJA Video Systems — Senior Staff Engineer 2008–2015

Embedded C++ on Linux-based video capture and processing hardware for film production and broadcast. Low-level, performance-critical work alongside recognized leaders in video hardware.

Sabre Holdings — Chief Architect, Airline Solutions 2007–2008

Set and validated the technical architecture and roadmap for a global airline-software organization. Technical oversight across a portfolio driving roughly 150 products, balancing standards against tight delivery deadlines.

Sun Microsystems — Senior Java Architect / Enterprise RFID Architect 2001–2006

Lead architect delivering J2EE platform and design-pattern work through full system lifecycles, including a complete re-architecture of one of the highest-value travel sites in the world. Recognized RFID subject-matter expert; led the RFID technology incubator.

Earlier roles

- **Micro Beef Technologies:** Embedded C control systems for cattle feedyards on QNX and MSDOS. Built a checksummed asynchronous packet protocol over radio modems for a mission-critical feedmill batching system deployed at 65 sites, plus an RFID animal-tracking system. (AgTech, embedded.)
- **Bureau of Reclamation (via Anteon):** SCADA control code and operating procedures for Imperial Dam and Lower Colorado River water-control systems. Remote telemetry in Sutron Data Language; Java water-planning application.
- **BancCorp Systems:** Single-codebase trust-banking system in C and RPG III across MSDOS, Novell, and AS/400.

SELECTED PROJECT

Cloud cost-audit CLI (in development). A command-line tool that audits AWS accounts for cost-configuration problems and produces a locked report. Scans regions concurrently and runs under a strictly read-only IAM policy. Built around a small set of named types and a per-service check interface for clean extensibility.
